Assessment Criterion	Assessment Sub-Criterion	Route Option BG1 (Main Street)	Route Option BG2 (ITT)	Route Option BG3 (Airton Road)	Route Option BG4 (Mayberry Road)
	Transport Reliability and Quality of Service	Journey Time: 5 - 6 mins Length: 2.0 km No. of Junctions: 5 Bus lanes are provided along approximately 70% of this route option. However, the presence of the bus gate at the western end of Main Street restricts the flow of traffic through the village. Lack of bus lanes through this section would affect reliability of services running along it.	Journey Time: 4 - 5 mins Length: 1.6 km No. of Junctions: 3 Bus lanes are provided along approximately 60% of this route option. While no bus lanes are provided through the ITT campus, the flow of traffic through the campus is only permitted outside of peak hours meaning buses would likely not be delayed through this section. Furthermore, through traffic is discouraged outside of peak hours through the use of speed ramps on the campus roads. As a result, this route option is considered to have good journey time reliability.	Journey Time: 4 – 5 mins Length: 1.7 km No. of Junctions: 3 Bus lanes are provided along the full length of this route option resulting in good journey time reliability of bus services.	Journey Time: 4 - 5 mins Length: 2.0 km No. of Junctions: 3 Bus lanes are provided along the full length of this route option resulting in good journey time reliability of bus services.

	Transport Reliability and Quality of Service	Bus lanes would be provided to the stop line thereby providing potential for good journey time reliability through the junction. Bus lanes would break for a short section in advance of the stop line to facilitate access to the left turn lane.	Bus lanes would be provided to the stop line thereby providing potential for good journey time reliability through the junction. Bus lanes would break for a short section in advance of the stop line to facilitate access to the left turn lane.	Bus lanes would be provided to the stop line thereby providing potential for good journey time reliability through the junction. Bus lanes would break for a short section in advance of the stop line to facilitate access to the left turn lane.
	Rank			
Integration	Transport Network Integration	This option would likely have a negative impact on traffic at the junction. The diversion of traffic from Cromwellsfort Road to St. Peters Road and restriction to left in left out from Cromwellsfort Road would likely result in a large volume of traffic diverting to St.Peters Road. Delays to vehicles on this approach would therefore be likely.	This option would likely have a negative impact on traffic at the junction. It is possible to provide approximately 45m separation between the two junctions allowing 7-8 vehicles to store between the junctions thereby improving the junction performance.	This option would likely have a negative impact on traffic at the junction. It is not possible to provide much separation between the two junction (approximately 20m) meaning the junction would in effect operate as a single signalised junction. This would reduce the efficiency and capacity at the junction.

Assessment Criterion	Assessment Sub-Criterion	Option 4 (4-arm Signalised Junction, Ballymount Road Local Access Only, Cromwellsfort Road LILO)	Option 5 (Double Signalised Junction North-South with Ballymount Road Local Access Only)	Option 6 (Double Signalised Junction East-West with Ballymount Road Local Access Only)
		The closure of the Ballymount Road would reduce the volume of traffic at the roundabout but may create issues elsewhere due to rerouted traffic (approximately 1,400 – 1,500 movements currently on Ballymount Road in each peak period).	The closure of the Ballymount Road would reduce the volume of traffic at the roundabout but may create issues elsewhere due to rerouted traffic (approximately 1,400 – 1,500 movements currently on Ballymount Road in each peak period). 	Flora & Fauna	The route does not cross any site of International, European or National conservation value. The route does not traverse any streams or rivers. Road widening (approx. 5m each side) will result in land-take from adjacent properties and the park which runs alongside the road. This would result in the loss of the existing tree lined corridor (approx.90 trees) many of which are mature trees. These trees are considered to be of ecological value. Impacts to the sports ground and the green area on the eastern side of the route immediately south of the junction with St. Agnes Road will comprise loss of green space and the hedgerow which borders the route. This is considered to be of local ecological value.	The route does not cross any site of International, European or National conservation value. The route does not traverse any streams or rivers. Road widening on Bunting Road (approx. 3m each side) will result in the loss of the existing tree lined corridor (approx.90 trees) many of which are mature trees. These trees are considered to be of ecological value. This route option is unlikely to impact the sports ground however land-take would be required from the green area on the eastern side of the route immediately south of the junction with St. Agnes Road. This would result in a loss of the hedgerow at this location which is considered to be of ecological value. Along Walkinstown Road, road widening will result in partial loss of front gardens along the western extent of Walkinstown Road. It is considered that the gardens could be of local ecological value. Road widening will also be required along Drimnagh Road to facilitate the introduction of raised adjacent cycle lanes. This will result in land-take from properties along the southern sides of the road with loss of front gardens and 14 trees within the existing footpath. It is considered that the gardens could be of local ecological value. However, even with a scheme in place there would still be areas of these gardens remaining and there are other similar managed habitats in the vicinity (e.g. parks, gardens etc.). The potential ecological impact is therefore considered to be minor.	The route does not cross any site of International, European or National conservation value. The route does not traverse any streams or rivers. Widening on St. Mary's Road will be confined to the road reserve and may result in loss of some minor trees. These are not considered to be of ecological value. Further south widening works within the reserve on Bunting Road will result in loss of existing tree lined corridor (approx. 40 trees) many of which are mature trees. These trees are considered to be of ecological value.

Future potential for interchange with the Luas line to Lucan and the DART Underground line at Christchurch. There would be a moderate impact on general traffic due to the conversion of a traffic lane to a bus lane on Patrick Street outbound (i.e. reduction in capacity).	This route coincides with portions of existing bus routes 13, 27, 40, 49, 54a, 56a, 77a, 77x, 123, 150, 151, and 747. Potential for interchange with other Dublin Bus Services on the George's Street and Liffey Quay corridors. Future potential for interchange with the Luas line to Lucan and the DART Underground line at Christchurch. There would be a moderate impact on general traffic due to the conversion of a traffic lane to a bus lane on Patrick Street outbound (i.e. reduction in capacity).	This route coincides with portions of existing bus routes 13, 27, 40, 49, 54a, 56a, 77a, 77x, 123, 150, 151, and 747. Potential for interchange with other Dublin Bus Services on the George's Street and Liffey Quay corridors. Future potential for interchange with the Luas line to Lucan and the DART Underground line at Christchurch. There would be a moderate impact on general traffic due to the removal of a traffic lane on Kevin Street Upper inbound to provide dedicated raised adjacent cycle lanes (i.e. reduction in capacity).	This route coincides with portions of existing bus routes 13, 27, 40, 49, 54a, 56a, 77a, 77x, 123, 150, 151, and 747. Potential for interchange with other Dublin Bus Services on the George's Street and Liffey Quay corridors. Future potential for interchange with the Luas line to Lucan and the DART Underground line at Christchurch. There would be a moderate impact on general traffic due to the conversion of a traffic lane to a bus lane on Kevin Street Upper outbound (i.e. reduction in capacity).

1 Introduction

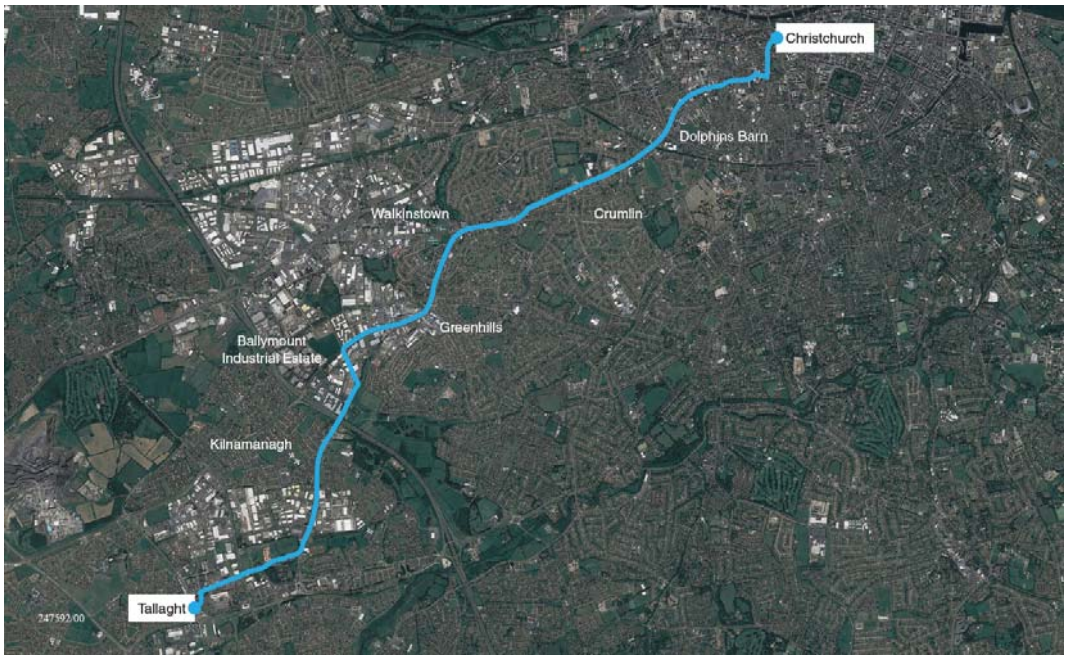
1.1 General

Arup has been appointed by the National Transport Authority (NTA) to undertake a feasibility and routes options assessment for the Greenhills to City Centre Core Bus Corridor. As part of this, this Stage 1 Road Safety Audit (RSA) of the concept scheme design is being carried out by the Arup Road Safety Audit team.

The concept scheme starts in Tallaght in West Dublin and continues North East along Greenhills Road and the R110 as far as Christchurch in the city centre. The proposed scheme includes the provision of new roads and junctions, upgrading of the existing roads and junctions and the provision of extensive new bus and cycle facilities along the route.

A plan showing the location of the scheme and extents is presented in Figure 1, below.

Figure 1: Scheme Location and Extents



1.2 Scheme Description

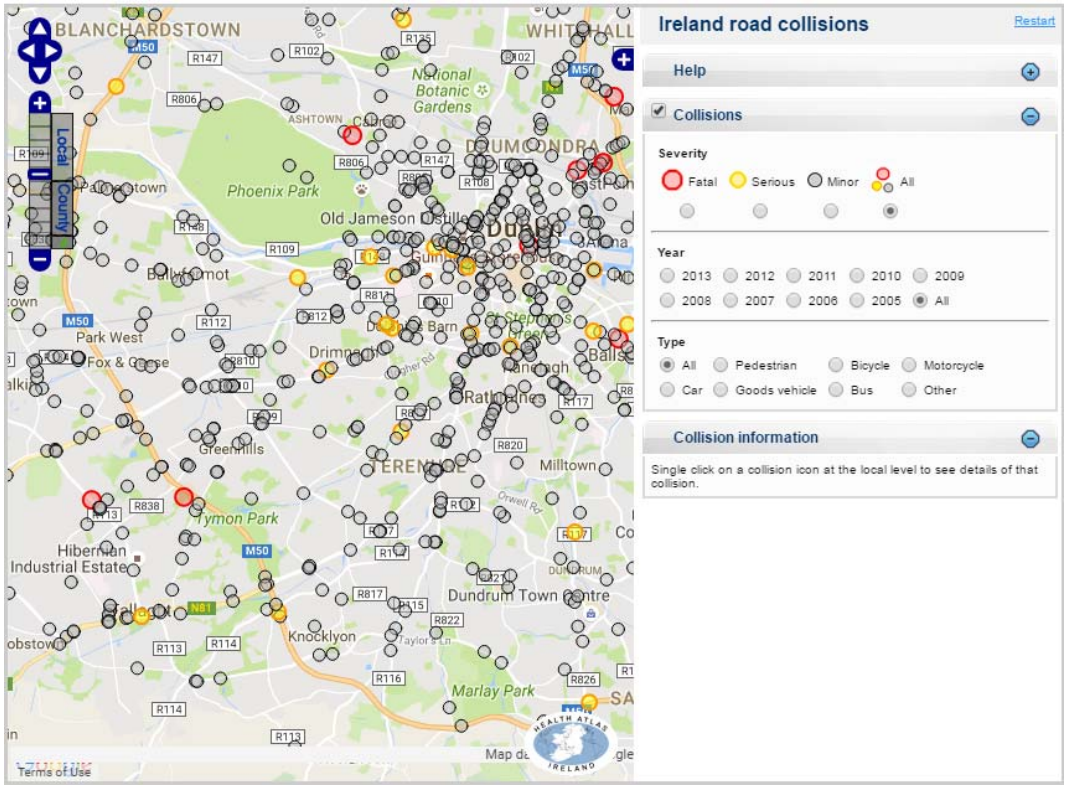
This scheme involves the delivery of the on-street infrastructure necessary to provide as near practical continuous priority for bus movements along the CBC route. This scheme also aims to provide on-street cycle facilities, segregated where practical to do so, and specifically providing for any cycle facilities along the route that are required under the Greater Dublin Area Cycle Network Plan.

In total, the emerging preferred route measures 11.2km. The proposed scheme is expected to improve the bus infrastructure provision along the route to approximately 91% (10.2km) in each direction. The proposed bus lanes along the route are to be 24-hour routes.

1.3 Collision History

A brief review of the collision history available on www.rsa.ie indicates many incidents on the existing road network in the locations where the proposed scheme will upgrade the road network. The available collision history covers the years 2005-2013 (inclusive). The route has a low cyclist-related collision history along the entire length, and a moderate pedestrian collision history. Clusters of pedestrian incidents were observed in particular on the R110 Long Mile Road, which is a primary traffic route in and out of Dublin.

Figure 3: RSA Collision History



1.4 Audit Team Details

The audit team members were as follows:

- Shane FitzGerald (Team Leader), Arup;
- Thomas Connell (Team Member), Arup;
- Clifford Killeen (Team Member), Arup; and
- Rachael Gannon (Observer), Arup.

1.5 Audit Methodology

The audit was carried out on 9th November 2016 during day time hours. The site was visited by Thomas Connell and Shane FitzGerald of the Road Safety Audit team.

The audit comprised an examination of the drawings relating to the scheme and a site visit made on Wednesday, November 9th 2016, between the hours of 12:30 and 16:00. During the site visits the weather was mostly clear and the road surface dry.

Information provided to assist the audit team comprised a series of layout drawings, listed in **Appendix A**. No previous Road Safety Audit has been carried out on this scheme.

The Audit has been carried out in accordance with the Transport Infrastructure Ireland (TII) document GE-STY-01024 "Road Safety Audits". The team has examined only those issues within the design relating to road safety implications of the scheme, and has therefore not examined or verified the compliance of the design to any other criteria.

A completed audit feedback form, signed by the designer and audit team leader is provided in Appendix A.

2 General Items Raised as part of this Stage 1 RSA

2.1.1 Problem: Screening and protection between old and new alignments

Location: Greenhills Road, Old Greenhills Road and Treepark Road.

Problem: There are a number of locations where new road infrastructure is shown on the drawings to be adjacent to existing (Dwg T0100-05 & 06 refer). There are also extensive level differentials between old and new carriageway proposals. Alignments that are parallel and closely located can lead to incidents arising from headlight glare, while significant vertical alignment issues can pose risks associated with errant vehicles leaving the carriageway. There are also a number of routes which will become cul-de-sacs due to the realignment proposals along the scheme, which are shown on the scheme drawings to be located extremely close to the new alignments.

Recommendation: Sufficient screening should be employed between adjacent carriageway alignments to mitigate against headlight glare. Elevated sections of carriageway should be provided with sufficient edge protection treatments where necessary.

2.1.2 Problem: Consistency of Route/Prohibited Movements

Location: Throughout scheme.

Problem: There is significant inconsistency throughout the scheme with regard to the permitting or prohibition of turning movements at junctions. For example, at the junction of Belgard Square North/Belgard Square West (Dwg T0100-02) a single left-turn movement is prohibited. A similar situation is shown at the junction of Greenhills Road/Castletymon Road (Dwg T0100-05). At the junction of South Circular Road/Dolphin's Barn (Dwg T0100-14), left-turn movements are prohibited from Dolphin's Barn. The area shown on Dwg T0100-01 which will become a bus-only link is not signed as such on the approaches from the north or south. At other locations, the proposals indicate that turning movements will not be permitted, but there is no associated signage to indicate this – for example at the junction of Belgard Square West/Belgard Square North (Dwg T0100-01) and the junction of Parnell Road/Dolphin's Barn (Dwg T0100-14) the bus lane configuration on the approaches (i.e. no termination of bus lanes) indicates that turning movements are not permitted, but are not signed as such on the scheme drawings.

It is not clear from the supplied drawings as to why turning movements are prohibited at specific junctions (and indeed on specific arms only). Inconsistency along a route which is intended to be largely homogenous in its' layout can lead to driver confusion and a significantly increased risk of incidents involving side-impact type collisions associated with turning movements across opposing traffic flows. In addition, the presence of cycle facilities along the scheme, across multiple junctions could further exacerbate the risk of vehicle/cyclist conflict.

Recommendation: The design team should seek to achieve as much consistency as is practically possible along the route in terms of junction control and permitting movements for vehicles where safe to do so. Where turning movements are to be prohibited, a comprehensive signage program will be required along the route to reinforce this, to advise alternatives and to minimise the risk of driver confusion.

2.1.3 Problem: Consistency of Commencement of Bus/Cycle Lanes

Location: Throughout scheme.

Problem: In many locations on the supplied drawings, the proposed bus and cycle facilities commence shortly after junctions by means of a gradual taper to guide traffic into the appropriate lanes. However in other locations these facilities are seen to immediately develop shortly after junctions. The lack of sufficient means to develop specific bus and cycle lanes can lead to sudden vehicle movements and driver confusion.

Recommendation: The design team should ensure consistency of proposals throughout the scheme for the commencement of bus and cycle lane facilities.

2.1.4 Problem: Bus/Cycle facility segregation

Location: Throughout scheme.

Problem: The proposals for the majority of the scheme comprise an on-road bus lane and on-road cycle lane adjacent to each other, on both sides of the route. The total width of the proposals combined is 5m (3m bus lane and 2m cycle lane). Throughout the entire scheme there are proposed bus stops shown which are kerbside, therefore being within the cycle lane.

This situation will force cyclists to weave around a stopped bus, out of the cycle lane and into the bus lane when they wish to overtake stationary buses. This, in turn brings cyclists into closer proximity to general traffic, which will increase the risk of vehicle/cyclist conflict.

Recommendation: The design team should consider providing segregated cycle facilities along the route to separate bus and cycle traffic.

2.1.5 Problem: Footpath Widths

Location: Belgard Square North.

Problem: The supplied drawings indicate achievement of a 2m minimum footpath width along the majority of the scheme length (in many cases necessitating widening to achieve). However on Belgard Square North (Dwg T0100-02) there are a number of locations where the existing footpath appears to have been reduced due to the proposals, including in the vicinity of the hospital entrance and in the vicinity of the junctions with Belgard Square East, and Belgard Road.

Recommendation: The design team should ensure that sufficient footpath width is provided throughout the scheme.

2.1.6 Problem: Entry/Exit Lanes at Junctions

Location: Numerous junctions throughout the scheme.

Problem: The supplied drawings show a number of junctions where there are multiple entry lanes on one approach, with two 'ahead' lanes (one of which being a Bus Lane in some instances), but the opposite side of the junction (receiving) has a single lane. Examples include the junction of Ballymount Avenue and Calmount Road (Dwg T0100-07), the proposed replacement signalised junction at Walkinstown Roundabout (Option B – Dwg T0100-08B), the junction of Crumlin Road and Sundrive Road (Dwg T0100-13), the junction of Dolphin's Barn and Parnell Road (Dwg T0100-14) and the junction of High Street and Nicholas Street (Dwg T0100-17). Such arrangements can lead to sudden vehicle manoeuvres or braking when traffic is forced to suddenly merge due to insufficient lane provisions, increasing the risk of vehicular incidents and also the risk of vehicle/cyclist conflict due to sudden evasive manoeuvres.

Recommendation: The design team should ensure that the entry and exit lane configuration at junctions is consistent and that there is sufficient lane designation to accommodate same.

2.1.7 Problem: Advance Stacking Lanes (ASL's) for cyclists

Location: Throughout scheme.

Problem: The supplied drawings do not indicate proposals for right-turning cyclists at the majority of junctions throughout the scheme. There are a limited number of locations where box turning areas are shown, or a derivative of the jug turning layout, but the majority of locations do not show dedicated ASL facilities for right turning cyclists. It is not clear as to whether the speed limit on the route is appropriate for such facilities. The lack of facilities for right-turning cyclists could lead to an increased risk of vehicle/cycle conflict.

Recommendation: The design team should consider provision of facilities to accommodate right-turning cyclists at the various junctions along the scheme.

2.1.8 Problem: Cycle Lane Hatching

Location: Throughout scheme.

Problem: The supplied drawings do not indicate any proposals for cycle lane surface colouring. In particular, crossing and approaching junctions, where there will be an increased likelihood of vehicle/cyclist conflict, particularly where traffic flow must cross cycle lanes for access. The absence of suitable visual delineation of cycle facilities throughout the scheme can lead to an increased risk of incidents.

Recommendation: The design team should consider providing cycle lane surface colouring in accordance with the guidance in the National Cycle Manual.

2.1.9 Problem: Lack of Pedestrian Facilities on specific arms of junctions

Location: Throughout scheme.

Problem: The supplied drawings indicate a number of junctions where pedestrian facilities are proposed on some of the junction arms, but not on others.

Examples include the junction of Belgard Square South and Belgard square West, and the junction of Old Blessington Road/Belgard Square West (both on Dwg T0100-01), the junction of Greenhills Road and the ITT Access Road (Dwg T0100-03), the junction of Greenhills Road and Airton Road (Dwg T0100-04), Greenhills Road and Mayberry Road (Dwg 04), the junction of Greenhills Road and Ballymount Road Upper (Dwg 05), the junction of Walkinstown Road and Kilnamanagh Road (Dwg 09) and the junction of Dolphin's Barn and Parnell Road (Dwg 14). The absence of crossing facilities on certain junction arms can lead to an increased risk of vehicle/pedestrian conflict.

Recommendation: The design team should consider providing crossing facilities on all arms of signalised junctions, where feasible.

3 Items at Specific Locations raised as part of this Stage 1 RSA

3.1.1 Problem: Bus Only Route on Belgard Square West

Location: Junction of Belgard Square West and Belgard Square South

Problem: It is not clear from the supplied drawings as to whether or not a left-turning manoeuvre will be possible for buses turning left from Belgard Square West to Belgard Square South. There are no signs proposed on the supplied drawings to indicate prohibitions on this movement, but the kerb alignment indicated would likely make this movement impractical. The lack of clarity on permitted movements could lead to an increased risk of vehicular incidents.

Recommendation: The design team should clarify if particular turning movements are prohibited at this location, and appropriate signage should be incorporated into the scheme design if necessary.

3.1.2 Problem: ITT Access Road

Location: ITT Access Road linking Greenhills Road to IT Tallaght.

Problem: Drawing T0100-03 shows the proposed ITT Access Road. It is not clear from this drawing if the route will have provisions for pedestrians and cyclists, or to what extent. The lack of these facilities on an access route to IT Tallaght could lead to an increased risk of incidents. In addition, the route appears narrow for two-way traffic, in particular for two-way bus traffic.

Recommendation: The design team should ensure that facilities for pedestrians (including crossings) and cyclists are incorporated into the ITT Access Road design. The design team should also ensure that the road is sufficiently wide for the anticipated traffic expected.

3.1.3 Problem: Bus & Cycle Lane Termination

Location: Tallaght Athletic Club entrance.

Problem: Drawing T0100-03 shows the Tallaght Athletic Club & Westpark Fitness Centre access from Greenhills Road. At the entrance, the proposed bus lane terminates and is required to merge with general traffic. At the same time, the proposed cycle lane adjacent to the bus lane begins to terminate, but continues through the junction while doing so, before terminating at the junction stop line. The continuation of the cycle lane past the termination and merge of the bus lane could lead to an increased risk of cyclist/bus conflict if the bus encroaches onto the cycle lane.

Recommendation: The design team should consider terminating the cycle route in an alternative location to the proposed bus lane termination and associated merge with traffic, or provision of greater segregation for cyclists at this location.

3.1.4 Problem: Multiple Accesses to Old Greenhills Road

Location: Greenhills Road (realigned) approaching M50 overbridge.

Problem: Drawing T0100-05 shows the proposed realignment of Greenhills Road, and the various proposals for tie-in and access to the Old Greenhills Road. To the south, a signalised junction is proposed to link the two, while to the north, a one-way in link is proposed (unsignalised) from Greenhills Road to the Old Greenhills Road. This access is skewed, and could result in significant numbers of right-turning vehicles from Greenhills Road, in a location where there are two lanes of traffic opposing this (including a bus lane). There could be an increased risk of vehicular incidents at this location as a result.

Recommendation: The design team should consider removal of the right-turning movement of traffic to the one-way in access to Old Greenhills Road at this location.

3.1.5 Problem: Bus Lane Termination approaching overbridge

Location: Greenhills Road, approaching M50 overbridge from south.

Problem: Drawing T0100-05 shows a proposed northbound bus lane, which is shown to terminate immediately prior to the route crossing over the M50.

The bus lane will terminate and buses will be expected to merge back with general traffic. This location is coincidental with a bend in the proposed realigned Greenhills Road, from right to left, which means that buses waiting to merge at the end of the bus lane could be obstructing forward visibility to the overbridge and the oncoming traffic. If vehicles attempt to weave around a bus waiting to merge, or attempt to overtake a merging bus they could potentially move into the path of oncoming vehicles, possibly leading to an increased risk of head-on collisions. It is noteworthy that the opposite side of the overbridge has a similar situation on approach, but a bus gate is provided at the merge location.

Recommendation: The design team should consider providing a bus gate at the merge location, or terminating the bus lane further south.

3.1.6 Problem: Bus Stop close to left-slip

Location: Ballymount Avenue/Calmount Road Junction

Problem: Dwg T0100-07 shows the proposed arrangement at the junction of Ballymount Avenue and Calmount Road. There is a bus and cycle-only left-slip proposed from Calmount Road to Ballymount Avenue, following which, on Ballymount Avenue the bus lane and cycle lane continue south alongside a general traffic lane. Shortly after turning on to Ballymount Avenue, there is a proposed bus stop and bus bay shown, which would require cyclists to either stop or to weave around stationary buses. This could lead to an increased risk of vehicle/cyclist conflict at this location, given that the bus and cycle lanes are using the left-slip lane and ‘merging’ with a traffic lane.

Furthermore, it is not clear how westbound cyclists will pass through the junction from east to west – the indicated layout suggests that cyclists will be required to weave across multiple lanes of traffic to get from the cycle lane (and the left-slip to Ballymount Avenue) to the straight ahead lane.

Recommendation: The design team should consider locating the proposed bus stop further south. In addition, the design team should consider proposals for westbound cyclists at the junction.

3.1.7 Problem: Transition of Cyclists to on-road

Location: Walkinstown Roundabout.

Problem: Dwg T0100-08A shows the proposed Option A for Walkinstown Roundabout (the junction remains a roundabout in this scenario). The junction layout shows the cycle lanes on the approaching entry arms all transitioning to off-road before entering the junction, and subsequently cyclists are facilitated with crossings to change arms, and with a ramp back down to carriageway level once they have exited the roundabout. On the majority of the roundabout exit arms, the transition of the cycle lanes back to on-road occurs quite shortly after exiting the junction, and would appear to be encouraging cyclists to merge back with general traffic flow in locations that are not wide enough for the two to be segregated. This could lead to an increased risk of vehicle/cyclist conflict on what is an extremely heavily-trafficked junction.

Recommendation: The design team should consider providing greater segregation for cyclists from general traffic when merging upon exiting the junction, or to relocating the transitions to on-road further away along the roundabout exit arms.

3.1.8 Problem: Advisory Cycle Lane Provision

Location: Greenhills Road.

Problem: Dwgs T0100-06 & 07 show the proposed realignment of Greenhills Road to connect directly with Ballymount Avenue. The older alignment of Greenhills Road will be amended to provide advisory on-road cycle lanes and a new roundabout junction at a new road link to connect to Calmount Avenue. The older Greenhills Road alignment here will therefore be for local access only. Typical carriageway width along this route appears to be approximately 8m. On-road advisory cycle facilities are proposed. The carriageway width appears to be insufficient for mandatory cycle facilities, but too wide to function as a 'wide shared street' type arrangement. The carriageway width and the proposals for on-road advisory cycle lanes may encourage excessive vehicle speeds, and the 8m width is not sufficient for mandatory cycle facilities to be provided.

This may therefore lead to an increased risk of vehicles travelling at speed, and occupying portions of the advisory cycle lane. There are also no cycle facilities through the proposed roundabout junction to Calmount Avenue. A similar situation is also shown on Dwg T0100-11, which shows the roundabout junction of Kildare Road /Clonard Road – in this location mandatory cycle facilities are proposed on-road, but no facilities are shown at the roundabout.

Recommendation: The design team should consider reducing the total carriageway width to a 'wide shared street' arrangement, where cyclists are encouraged to 'take the lane' and appropriate signage and markings are provided to reinforce this. The design ream should also consider an alternative junction arrangement at the junction with the new link road to Calmount Avenue.

3.1.9 Problem: Access to Tallaght Truck Dismantlers Property

Location: Greenhills Road, approaching M50 overbridge from north.

Problem: Drawing T0100-05 shows the proposals on Greenhills Road, approaching the M50 overbridge from the north. The drawings indicate a proposed bus gate shown at the access to the Tallaght Truck Dismantlers property. It is not clear as to how this access to the property will function as a result of the proposals. Traffic exiting may be obstructed by buses positioned at the bus gate, which may increase the risk of incidents, while traffic entering the site may have visibility obstructed by buses in the bus gate, which could lead to an increased risk of conflict with other vehicles and pedestrians and cyclists.

Recommendation: The design team should consider relocation of the access to this property further north.

3.1.10 Problem: On-Street Parking & Proposed Cycle Facilities on Kildare Road

Location: Along Kildare Road.

Problem: Dwgs T0100-10, 11 and 12 show the proposed facilities along Kildare Road. The drawings indicated on-road mandatory cycle facilities along the route. The carriageway typical width is indicated as approximately 10m on the drawings, with 2m cycle lanes proposed on either side.

It was noted from the site visit that extensive on-street parking is occurring on Kildare Road, as well as extensive parking on the wide footpaths in locations. The route also has extensive traffic calming in place. Although the supplied drawings indicate that on-street parking is 'to be removed', it is highly likely that parking will continue in the on-road mandatory cycle lanes proposed. This could lead to an increased risk of vehicle/cyclist conflict. It is also unclear from the scheme drawings if the existing speed control ramps are to remain.

Recommendation: The design team should consider providing segregated cycle facilities along this portion of the route. The design team should also clarify if the traffic calming along the route is to remain.

3.1.11 Problem: Cycle Lane/Loading Bay/Parking Conflict

Location: Drimnagh Road and Patrick Street.

Problem: Dwgs T0100-10, 16 & 17 show proposals for parallel parking areas adjacent to junctions, where inset parallel parking bays are shown kerbside, behind proposed bus and cycle facilities. In the case of Drimnagh Road, this appears to be parking for residential purposes, which is being rationalised and reduced as part of the scheme proposals, while on Patrick Street, these spaces are existing loading spaces. On Drimnagh Road, there are three parking spaces proposed immediately at the junction with Kildare Road, a bus stop, and further three parking spaces immediately thereafter. The provision of spaces so proximate to the junction itself may increase the risk of indiscriminate parking, obstruction of the cycle lane and an increased risk of vehicle/cyclist conflict. On Patrick Street, indiscriminate parking in loading bay areas can lead to increased vehicle/cyclist conflict in the event of the cycle lane being obstructed. It is noted that at present on Patrick Street there is an advisory cycle lane, which is being replaced with a mandatory cycle lane. The advisory cycle lane here is often occupied with double-parked vehicles.

Recommendation: The design team should consider removal of the parking spaces at Drimnagh Road. Consideration should also be given to providing a segregated cycle facility on Patrick Street.

3.1.12 Problem: Cycle Lane Pinch Points

Location: Multiple locations.

Problem: Dwg T0100-10 shows the proposals at the junction of Drimnagh Road and Saint Mary's Road/Kildare Road, Dwg T0100-14 shows the junction of Parnell Road and Dolphin's Barn, Dwg T0100-17 shows the junction of High Street and Christchurch Place and Dwg T0100-09 shows the junction of the Long Mile Road and Walkinstown Road. In these locations, the proposed cycle facilities appear to be quite narrow or are seen to abruptly terminate. Insufficient cycle lane width can lead to an increased risk of vehicle/cyclist conflict, while abrupt termination of facilities can lead to cyclist and driver confusion and an associated increased risk of incidents.

Recommendation: The design team should ensure a minimum width of mandatory cycle facility can be achieved throughout the scheme. Cycle facilities that appear to terminate abruptly should be suitably designed to transition back to general traffic flow safely.

3.1.13 Problem: Junction Alignment

Location: Crumlin Road/Herberton Road junction.

Problem: Dwg T0100-13 shows the proposals at the junction of Crumlin Road and Herberton Road. The approach from the south-west on Crumlin Road is shown to have three lanes entering the junction, one turning left, one going straight and one turning right. The alignment of the 'ahead' lane is seen to guide traffic into the pedestrian island on the opposite side of the junction. This poses an increased risk of vehicle/pedestrian conflict in the event of a vehicle mounting the island, but also poses an increased risk of sudden vehicle weaving to avoid the island, in an area where there is an advisory cycle facility proposed passing through the junction, which could lead to an increased risk of vehicle/cyclist conflict.

Recommendation: The design team should ensure vehicle pathways are designed so as to minimise conflict with other modes at this location. It may be necessary to consider removal of the advisory cycle lane proposed through the junction.

3.1.14 Problem: Opposing Right-Turning Movements

Location: Cork Street/Donore Avenue/Marrowbone Lane junction.

Problem: Dwg T0100-15 shows the proposals at the junction of Cork Street, Donore Avenue and Marrowbone Lane. It is not clear from the supplied drawings if right-turning movements are to be retained as part of the proposals for this junction. No dedicated right-turning lanes are indicated on the scheme drawings (right-turning traffic will use the same lanes as straight ahead traffic), and the stagger of the junction is such that these opposing right-turning movements will have to pass each other. The proposals will also reduce the number of lanes for straight through traffic to one lane in each direction on the approaches. In the event of vehicles waiting to turn right into either side road, traffic travelling ahead will also be obstructed, which may increase the risk of vehicles using the bus lanes and cycle lanes to 'undertake' these stationary vehicles that are waiting to turn right. This could lead to an increased risk of vehicular incidents.

Recommendation: The design team should clarify if the proposed reconfiguration of this junction has been sufficiently assessed in terms of its operating capacity, and if there will be likely delay due to vehicles waiting to turn right.

3.1.15 Problem: Loss of traffic lane

Location: High Street/Nicholas Street junction.

Problem: Dwg T0100-17 shows the proposals at the junction of High Street and Nicholas Street. The drawings indicate two right-turning lanes from High Street to Nicholas Street, but only a single traffic lane with a bus lane and cycle lane adjacent on Nicholas Street. The sudden loss of a traffic lane can lead to an increase in weaving manoeuvres for vehicles and an associated increased risk of vehicular conflict and potential conflict with other modes.

Recommendation: The design team should clarify the proposals for right-turning traffic from High Street to Nicholas Street.

3.1.16 Problem: Access to Saint Peters Road

Location: Walkinstown Roundabout (Option B).

Problem: Dwg T0100-08B shows the proposals for Option B of the proposed upgrade to Walkinstown Roundabout, which changes the junction to a signalised crossroad junction with an adjacent priority junction to Saint Peters Road. The supplied drawings indicated that a left turn from Greenhills Road to Saint Peters Road (immediately after exiting the crossroads to Greenhills Road) will not be permitted (the bus lane here is not shown to terminate for left-turning traffic). The absence of this turning movement at the junction re-design could lead to an increased risk of drivers ignoring the restriction to avoid diverting on potentially circuitous alternative routeing. This could in turn lead to an increased risk of incidents.

Recommendation: The design team should clarify the proposals for left-turning traffic from Greenhills Road to Saint Peters Road.

3.1.17 Problem: No permitted access

Location: Kilnamanagh Road/Walkinstown Road junction.

Problem: Dwg T0100-09 shows the proposals at the junction of Kilnamanagh Road/Walkinstown Road and the adjacent shopping centre on the eastern side of Walkinstown Road. The drawings indicate that all turning movements from Walkinstown Road into Kilnamanagh Road and to the shopping centre are to be prohibited. It is not clear as to why these turning movements are to be removed from the slightly staggered junction. It is likely that significant numbers of drivers will choose to ignore these restrictions and make these turning movements regardless, given that these closures will require traffic to seek alternative routes. Furthermore, the northern access to the shopping centre is not indicated on the supplied drawings (i.e. an interruption to the bus lane is not shown at this access, which will become the sole access as part of the scheme proposals).

Recommendation: The design team should clarify the rationale for the access restrictions. Consideration should be given to making Kilnamanagh Road one-way eastbound approaching the junction to further reinforce the restriction if it is to remain.

3.1.18 Problem: Left-turn to South Circular Road

Location: Dolphin's Barn/South Circular Road junction & approaches.

Problem: Dwg T0100-14 shows the proposals at the junction of Dolphin's Barn and Rehoboth Road, and at the junction of Dolphin's Barn and South Circular Road. The drawings indicate that the existing left-turn from Dolphin's Barn (southbound) to South Circular Road is to be removed, while also showing a termination of the bus lane to facilitate the left-turn from Dolphin's Barn to Rehoboth Road. The proximity of both junctions to each other along Dolphin's Barn could lead to drivers mistakenly assuming that the termination of the bus lane for the turn to Rehoboth Road is also for left-turning to South Circular Road. Given that the left turn from Dolphin's Barn to Parnell Road is also prohibited (this would be the next available left turn after South Circular Road) there is an increased risk of drivers ignoring the restriction as well as potentially erroneously assuming the restriction is not present, and an associated risk of drivers using Rehoboth Road as a rat-run.

Recommendation: The design team should clarify the rationale for the access restrictions. Consideration should be given to retaining the left-turning movement to South Circular Road.

3.2 Comments/Notes

3.2.1 Comment: Incorrect Pedestrian Crossing Stagger

Location: Drimnagh Road/Kildare Road junction, Parnell Road/Dolphin's Barn junction and Crumlin Road/Herberton Road junctions.

Comment: Dwgs T0100-10, 13 and 14 illustrate pedestrian crossing proposals at the three junctions referred to above. In many instances these are existing junctions that are locally impacted by the proposals, and the existing crossing arrangements are to be retained. However at these three locations the stagger of the pedestrian crossings is contrary to best practice, with pedestrians facing away from oncoming traffic flow as they move from one crossing arm to another.

3.2.2 General Notes

Accident data was not available for the years 2014-present (inclusive). It is recommended that a more comprehensive dedicated accident investigation study be carried out for the route at detailed design stage.

A Stage 2 Road Safety Audit is recommended for the scheme.

No details of specific design elements such as drainage, lighting, surfacing, traffic signal arrangements, etc. were provided to the audit team – these items should form part of any Stage 2 audit.

4 Audit Team Statement

We certify that we have examined the drawing listed in the Appendix to this Report. The examination has been carried out with the sole purpose of identifying any features of the design that could be removed or modified in order to improve the safety of the scheme. The problems identified have been noted in this report, together with associated safety improvement suggestions, which we recommend should be studied for implementation. The Auditors have not been involved with the scheme design.

Scheme: Greenhills to City Centre Bus Corridor Options Study	Location: Dublin City Centre & environs
Audit Stage: Stage 1 Road Safety Audit	Date Audit Completed: 17 November 2016

	To be completed by Designer/Contractor					To be completed by Audit Team Leader	
Problem	Problem Accepted		Recommended Measure Accepted		Designers Response	Alternative Measures Accepted	
	Yes	No	Yes	No		Yes	No
2.1.1	✓		✓		The recommended measure will be considered at the detailed design stage.		
2.1.2	✓		✓		The recommended measure will be considered at the detailed design stage.		
2.1.3	✓		✓		The recommended measure will be considered at the detailed design stage.		
2.1.4	✓		✓		The detail of interface between buses and cyclists at stops will be developed at the detailed design stage.		
2.1.5	✓		✓		A 2m footpath is maintained along the entire length of the route. Drawings have been updated to address the pinch point identified by the auditors.		
2.1.6	✓		✓		The recommended measure will be considered at the detailed design stage.		
2.1.7	✓		✓		Drawings have been updated to show box turns or jug turns for right turning cyclists at signalised junctions along the route		
2.1.8	✓		✓		The recommended measure will be considered at the detailed design stage.		
2.1.9	✓		✓		The recommended measure will be considered at the detailed design stage.		
3.1.1	✓		✓		Buses will be permitted to turn left at this location and the junction has been designed accordingly.		
3.1.2	✓		✓		The recommended measure will be considered will be considered in consultation with IT Tallaght at the detailed design stage.		

3.1.3	✓	✓	Drawings have been updated to move the location of the cyclist merge further south. The detail of this merge will be developed further at the next design stage.
3.1.4	✓	✓	The drawings have been updated to show a banned right turn into the Old Greenhills Road.
3.1.5	✓	✓	The recommended measure will be considered at the detailed design stage.
3.1.6	✓	✓	The recommended measure will be considered at the detailed design stage.
3.1.7	✓	✓	The recommended measure will be considered at the detailed design stage.
3.1.8	✓	✓	The recommended measure will be considered at the detailed design stage.
3.1.9	✓	✓	The recommended measure will be considered at the detailed design stage.
3.1.10	✓	✓	The recommended measure will be considered at the detailed design stage.
3.1.11	✓	✓	The recommended measure will be considered at the detailed design stage.
3.1.12	✓	✓	Drawings have been updated to remove the abrupt termination of cycle facilities at Drimnagh Road/Kildare Road junction. A minimum cycle lane width of 2m has been maintained throughout the scheme. The detail of transitions between where dedicated cycle facilities are proposed and where none are proposed will be considered at the detailed design stage.
3.1.13	✓	✓	The recommended measure will be considered at the detailed design stage.
3.1.14	✓	✓	Drawings have been updated to remove the short sections of bus lane in the middle of the junction to generally return the junction to its current configuration which is seen to work without issue.

3.1.15	✓		✓	Drawings have been updated to show a single lane turning right from High Street into Nicholas Street
3.1.16	✓		✓	Drawings have been updated to terminate the bus lane just in advance of St. Peters Road to allow for a left turning vehicle.
3.1.17		X	X	Access restrictions have been proposed to facilitate bus lanes to the stop line in each direction. Alternative routes are available for each of the banned movements, with minimal diversion required as a result. As such the proposals are considered appropriate. The drawings have been updated to show the northern access to SuperValu and a break in the bus lane to facilitate same.
3.1.18	✓		✓	Access restrictions have been proposed to facilitate bus lanes to the stop line. Appropriate signage and linemarkings will be proposed to remove confusion over where the turn ban is in place. An alternative route for traffic wishing to get to South Circular Road is in place via Donore Avenue. Given the width restriction along Rehoboth Place, consideration will be given to making this road one-way northbound at the next design stage i.e. Rehoboth Place would be an exit only onto Cork Street.
3.2.1	✓		✓	The recommended measure will be considered at the detailed design stage.
